## MATH 120 Section 3.3 Future Value of an Annuity: Sinking Funds

Future Value of an Annuity
An annuity is a stream of periodic payments. If payments are made at the end of each time interval, then the annuity is called and ordinary annuity. The future value of an annuity is the sum of all payments plus all interest earned

$$
F V=P M T \frac{\left(1+\frac{r}{m}\right)^{m t}-1}{\left(\frac{r}{m}\right)}
$$

Sinking Fund: When an account is set up to accumulate funds for a future obligation, the account is Sinking fund.

$$
P M T=F V \frac{\left(\frac{r}{m}\right)}{\left(1+\frac{r}{m}\right)^{m t}-1}
$$

1. Recently, More Money $4 U$ offered an annuity that pays $7.5 \%$ compounded monthly. If $\$ 250$ is deposited into this annuity every month, how much is in the account after 15 years? How much of this is interest?

| $\mathbf{N}=$ |

| $\mathbf{P} / \mathbf{Y}=$ |
| $\mathbf{Y}=$ |

2. In order to accumulate enough money for a down payment on a house, a couple deposits $\$ 1389$ per month into an account paying $8 \%$ compounded monthly. If payments are made at the end of each period, how much money will be in the account in 8 years? How much interest was earned?

| $\mathbf{F V}=$ |
| $\mathbf{P} / \mathbf{Y}=$ |
| $\mathbf{C} / \mathbf{Y}=$ |

3. Acme Annuities recently offered an annuity that pays $3.3 \%$ compounded monthly. What equal monthly deposit should be made into this annuity in order to have $\$ 500,000$ in 40 years? How much of this amount is interest?

| $\mathbf{N}=$ |

| $\mathbf{Y}=$ |

4. A company estimates that it will need $\$ 199,000$ in 5 years to replace a computer. If it establishes a sinking fund by making fixed monthly payments into an account paying $3.1 \%$ compounded monthly, how much should each payment be?

| $\mathbf{N}=$ |

5. Bob makes his first $\$ 2500$ deposit into an IRA earning $6.4 \%$ compounded annually on his $23^{\text {rd }}$ birthday and his last $\$ 2500$ deposit on his $48^{\text {th }}$ birthday ( 26 equal deposits in all). With no additional deposits, the money in the IRA continues to earn $6.4 \%$ interest compounded annually until Bob retires on his $64^{\text {th }}$ birthday. How much is in the IRA when Bob retires?
